Write an equation of a line with the given slope and y-intercept.

1.  $m = \frac{1}{4}, b = \frac{-3}{4}$

$y = mx + b$

Equation:

$y = \frac{1}{4}x - \frac{3}{4}$

Write the equation for the line.

$y - y_1 = m(x - x_1)$

2. Equation:

$y - -1 = \frac{-3}{10}(x - 5)$

OR  $y - 2 = \frac{-3}{10}(x - -5) \quad m = \frac{3}{-10}$

Find the x- and y- intercept of the line.

3.  $2x + 36y = -18$

x-intercept:  $(-9, 0)$   $2x + 36(0) = -18$   
 $\frac{2x}{2} = \frac{-18}{2}$

y-intercept:  $(0, -\frac{1}{2})$   $x = -9$

$2(0) + 36y = -18$   
 $\frac{36y}{36} = \frac{-18}{36}$   
 $y = -\frac{1}{2}$

Graph the equation.

4.  $x = -4$

$x = \#$   
 $\updownarrow$   
 $m = \text{undefined}$

Graph the equation.

5.  $y = 6$

$y = \#$   $\leftarrow \rightarrow$   
 $m = 0$

Write an equation for the line through the given point with the given slope.

6.  $(4, -6); m = \frac{3}{5}$

$y - -6 = \frac{3}{5}(x - 4)$

Equation:

7. Find the slope of the given line.

$m = \frac{1}{3}$

8. A line passes through (2, -1) and (8, 4).

$y - (-1) = \frac{5}{6}(x - 2)$

a. Write an equation for the line in point-slope form. OR  $y - 4 = \frac{5}{6}(x - 8)$

b. Rewrite the equation in standard form using integers.

$m = \frac{4 - (-1)}{8 - 2} = \frac{5}{6}$

$Ax + By = C$

$y + 1 = \frac{5}{6}(x - 2)$

$y + 1 = \frac{5}{6}x - \frac{5}{3}$

$y = \frac{5}{6}x - \frac{8}{3}$

$6(y = \frac{5}{6}x - \frac{8}{3})$

$6y = 5x - 16$   
 $-6y$   
 $0 = 5x - 6y - 16$   
 $+16$   
 $16 = 5x - 6y$

Given the following points and equations, are the graphs of the lines parallel, perpendicular or neither? Explain.

9.  $y = 6x + 6$  //  
 $-18x + 3y = -54$   
 $+18x$   
 $3y = 18x - 54$   
 $\frac{3y}{3} = \frac{18x}{3} - \frac{54}{3} \rightarrow y = 6x - 18$

10.  $7x - 4y = 4$   
 $-7x$   
 $-4y = 3$  neither  
 $-4y = -x + 3$   
 $\frac{-4y}{-4} = \frac{-x+3}{-4} \rightarrow y = \frac{1}{4}x - \frac{3}{4}$

11. Determine whether WX and YZ are parallel, perpendicular, or neither

W (-3, 1), X (3, 2), Y (4, -2), Z (1, 1)

$m = \frac{2-1}{3-(-3)} = \frac{1}{6}$  }  $m = \frac{1-(-2)}{1-4} = \frac{3}{-3} = -1$   
 $y = \frac{7}{4}x - 1$

neither

Write the equation of a line that is perpendicular to the given line and that passes through the given point.

12.  $y = \frac{5}{3}x - 11, (0, 5)$

$\perp m = -\frac{3}{5}, (0, 5)$

$y = -\frac{3}{5}x + 5$

OR  $y - 5 = -\frac{3}{5}(x - 0)$

13.  $5x - 10y = -25, (2, 2)$

$-5x$   
 $-10y = -5x - 25$

$\frac{-10y}{-10} = \frac{-5x-25}{-10}$

$y = \frac{1}{2}x + \frac{5}{2}$

$\perp m = -2$

$y - 2 = -2(x - 2)$

Graph

14.  $y = \frac{1}{5}x + 3$

16. Write and graph an equation in point-slope form,  $y - y_1 = m(x - x_1)$ , of the line through points (4, -4) and (1, 2). Use (4, -4) as the point  $(x_1, y_1)$ .

Equation:  $y - -4 = -2(x - 4)$

15. Write and graph an equation in point-slope form of the line through point  $J(-5, 6)$  with slope  $-\frac{4}{1}$

$y - y_1 = m(x - x_1)$   
 $y - 6 = -4(x - -5)$

17. What must be true about the slopes of two perpendicular lines, neither of which is vertical?

- a. The slopes are equal.
- b. The slopes have product 1.
- c. The slopes have product -1.
- d. One of the slopes must be 0.

$\frac{3}{5} \quad -\frac{5}{3}$

18. Line  $p$  contains points  $A(-1, 4)$  and  $B(3, -3)$ . Line  $q$  is parallel to line  $p$ . Line  $r$  is perpendicular to line  $q$ . What is the slope of line  $r$ ? Explain.
